## TIME & WORK

---

Work :- Any amount of job done in order to achieve something in respect of time is called work.

Time :- It is the duration of time taken to complete the work.

Efficiency :- It is the amount of work done in a day or a month or an hour.

Formula :-

$$\boxed{\text{Total Work} = \text{Time} \times \text{Efficiency}}$$

$$\boxed{\text{Time} = \frac{\text{Total Work}}{\text{Efficiency}}}$$

$$\boxed{\text{Efficiency} = \frac{\text{Total work}}{\text{Time}}}$$

### PRACTICE EXAMPLES

#### BASIC QUESTIONS TYPE

Q. 1 A can do a work in 20 days, B can do the same work in 10 days. so in how many days can A and B do it together?

Sol:

Basic :-

Let the work is  $x$

Work done by A in 20 Days is  $x$

Work done by A in 1 Day is  $\frac{x}{20}$

Work done by B in 10 Days is  $x$

Work done by B in 1 Day is  $\frac{x}{10}$

So: Efficiency of A =  $\frac{x}{20}$  { Work done in a day is efficiency of a person

∴ Efficiency of B =  $\frac{x}{10}$

Total Time =  $\frac{\text{Total work}}{\text{Total Efficiency}}$

$$= \frac{x}{\frac{x}{20} + \frac{x}{10}}$$

$$= \frac{x}{\frac{x+2x}{20}} = \frac{x}{\frac{3x}{20}} = \frac{20}{3} = 6\frac{2}{3} \text{ days}$$

Formula:-

Time taken by A = 20 Days =  $t_1$

Time taken by B = 10 Days =  $t_2$ .

$$= \frac{t_1 \times t_2}{t_1 + t_2}$$

$$= \frac{20 \times 10}{20 + 10} = \frac{200}{30} = 6\frac{2}{3} \text{ days.}$$

TRICK

A - 20 Days	$\frac{20}{20} = 1$	efficiency of A
B - 10 Days	$\frac{20}{10} = 2$	efficiency of B

20 - Total work

Time =  $\frac{\text{Total work}}{\text{efficiency of B}}$

$$= \frac{20}{1+2} = \frac{20}{3}$$

$$= 6\frac{2}{3} \text{ Days}$$

Q. 2 A can do the work in 42 days. A and B together can complete the same work in 14 days then in how many days can B complete the same work?

Sol:

$$\begin{array}{ccc} A - 42 \text{ days} & \xrightarrow{1} & 42 - \text{TW} \\ A+B - 14 \text{ days} & \xrightarrow{3} & \\ \text{efficiency of } B = (A+B) - A = 3 - 1 = 2. & & \\ \text{B's time} = \frac{42}{2} = 21 \text{ Days.} & & \end{array}$$

Q. 3 A man, a woman and a child can complete the work in 5 days while the woman alone can complete the same work in 12 days and a child can complete the work in 20 days then how much will be taken by man if he does it alone?

Sol: Man + Woman + Child - 5

$$\begin{array}{ccc} & \xrightarrow{12} & \\ \text{Woman} - 12 & \xrightarrow[3]{5} & 60 \\ \text{Child} - 20 & & \end{array}$$

$$\begin{aligned} \text{Man's efficiency} &= 12 - (5+3) \\ &= 4 \end{aligned}$$

$$\text{Man's time} = \frac{60}{4} = 15 \text{ days.}$$

Q. 4 X and Y can together do a work in 12 days, Y and Z in 15 days and, Z and X in 20 days then in how many days will X, Y and Z do it together?

Sol:

$$\begin{array}{ccc} X+Y - 12 \text{ Days} & \xrightarrow{5} & \\ Y+Z - 15 \text{ Days} & \xrightarrow[3]{4} & 60 \\ Z+X - 20 \text{ Days} & & \end{array}$$

Efficiency of X, Y, Z

$$X+Y + Y+Z + Z+X = 5+4+3$$

$$2(X+Y+Z) = 12$$

$$X+Y+Z = \frac{12}{2} = 6$$

Q. 5 Sunita and Anita working alone can do a piece of work in 8 and 12 days respectively. If Sunita, Anita and Ravita do it together can do it in 4 days then in how many days will Ravita do it alone?

Sol: 24 days

Q. 6 Nitesh and Pawan can do a job together in 18 days, Pawan and Sumit can do it together in 27 days, Sumit and Nitesh can do the same work in 36 days then in how many days will Sumit finish it if he works alone?

Sol: 216 days

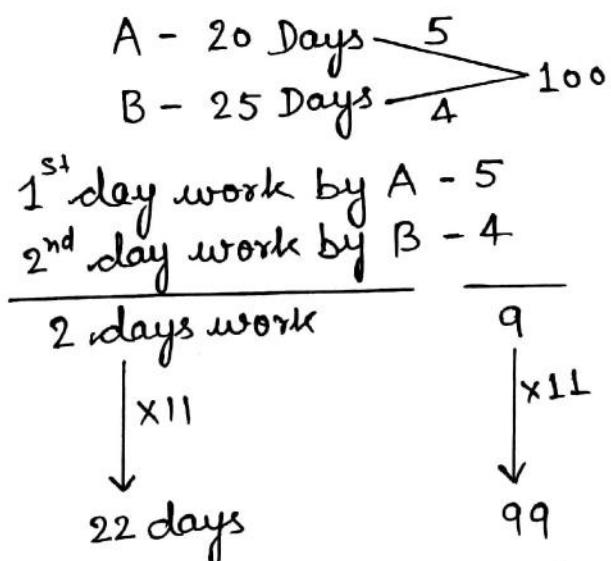

Q. 7 A and B can together do a work in 30 days, B and C do the same job in 36 days while C and A do it in 45 days, so in how many days can A alone, B alone and C alone do it separately?

Sol: 72 days,  $51\frac{3}{7}$  days, 120 days

#### ALTERNATE DAY TYPE:

Q. 8 A can do a piece of work in 20 days, B can do the same job in 25 days. If they work alternatively and A starts the work then in how many days will the whole work be finished?

Sol:

Remaining work =  $100 - 99 = 1$   
 Next day work will be done by A, so time =  $\frac{1}{5}$  days  
 Total time =  $22 \text{ days} + \frac{1}{5} \text{ days} = 22\frac{1}{5} \text{ days}$ .

Q. 9 A, B and C can do a piece of work in 15, 20 and 30 days respectively. A starts the work and work till the work finishes while B + C helps A in alternate days. In how many days will the work be finished?

Sol:

$$\begin{array}{l}
 \text{A - 15 days} \\
 \text{B - 20 days} \\
 \text{C - 30 days}
 \end{array}
 \begin{array}{c}
 \diagdown 4 \\
 \diagdown 3 \\
 \diagdown 2
 \end{array}
 \begin{array}{l}
 60 - \text{Total work} \\
 \hline
 \end{array}$$

$$\begin{array}{l}
 \text{1}^{\text{st}} \text{ day work done by A and B} = 4 + 3 = 7 \\
 \text{2}^{\text{nd}} \text{ day work done by A and C} = 4 + 2 = 6
 \end{array}
 \begin{array}{c}
 \hline
 \end{array}$$

$$\begin{array}{l}
 \text{2 days work} \\
 \downarrow \times 4 \\
 8 \text{ days}
 \end{array}
 \begin{array}{c}
 \hline
 13 \\
 \downarrow \times 4 \\
 52
 \end{array}$$

$$\text{Remaining work} = 60 - 52 = 8$$

$$\text{Next day work done by A and B} = 7 \times 1 = 7$$

$$\text{Remaining work} = 8 - 7 = 1$$

$$\begin{array}{l}
 \text{Next day work done by A and C} = \frac{1}{6} \text{ days} \\
 \text{Total Time} = 8 + 1 + \frac{1}{6} \\
 = 9 \frac{1}{6} \text{ days}
 \end{array}$$

Q. 10 A can do a piece of work in 20 days, B can do the same job in 25 days. If they work alternatively and B starts the work then in how many days will the whole work be finished?

Sol:  $22 \frac{1}{4}$  DAYS

Q. 11 A, B and C can do a work in 12, 15 and 20 days respectively. A starts the work and work till the end while B and C helps A every day. In how many days will the work be finished?

Sol:  $7 \frac{1}{3}$  DAYS

### WORK LEFT BEFORE AND AFTER:

Q. 12 A can do a work in 15 days while B can do the same work in 25 days. They started the work together but after 5 days A left the work so in how many days B finishes the remaining work?

Sol:

$$\begin{array}{c}
 | \quad 5 \text{ days} \quad | \\
 | \quad A + B \quad | \\
 \hline
 \begin{array}{l}
 A - 15 \text{ days} \xrightarrow{\frac{5}{3}} 75 \\
 B - 25 \text{ days} \xrightarrow{\frac{5}{3}} 75 \\
 | \quad 5 \text{ days} \quad | \quad \text{Remaining work} \\
 \hline
 \begin{array}{l}
 A + B = 8 \times 5 \\
 = 40 \\
 B's \text{ time} = \frac{35}{3} = 11 \frac{2}{3} \text{ days}
 \end{array}
 \end{array}
 \end{array}$$

Q. 13 A can do a piece of work in 45 days, B can do same work in 40 days. They started the work together but after some time A left the work. If the total work is finished in 32 days then after how many days did A leave the job?

Sol: ~~A - 45 days~~  $\frac{8}{9}$  ~~B - 40 days~~ 360 - Total work

B did the work for whole time  
 So work done by B =  $32 \times 9 = 288$   
 Remaining work =  $360 - 288 = 72$   
 A's Time =  $\frac{72}{8} = 9$  Days.

Q. 14 A can do a job 20 days and B can do it in 24 days, C can do it in 30 days. If they start the work together but A left the work 5 days after the start of work and C left the work 6 days before the completion of work then in how many days will the whole work be finished?

Sol: Basic: ~~A - 20 days~~  $\frac{6}{5}$  ~~B - 24 days~~  $\frac{5}{4}$  ~~C - 30 days~~ 120 T.W

$5 \text{ days}$	$B + C = \frac{15}{9} = 1 \frac{6}{9} \text{ days}$	$6 \text{ days}$
$A + B + C$	$= 120 - (75 + 30)$ $= 15$	$6 \times 5 = 30$

$$\text{Total time} = 5 + 1 \frac{6}{9} + 6 = 12 \frac{2}{3} \text{ days}$$

### # TRICK:

Total work

- (efficiency of person who left  $\times$  Time after how much time person left)

+ (efficiency of person who left  $\times$  Time before how much time person left)

(Total Work)  $\div$  (Sum of efficiency of people who worked)

$$\begin{array}{r} 120 \\ - 30 = 5 \times 6 \\ + 24 = 6 \times 4 \\ \hline 114 = 114 = 12 \frac{2}{3} \text{ days.} \end{array}$$

Q. 15 A can do a work in 8 days, B can do the same in 16 days and C can do it in 24 days. They start the work together and A works till the end but C left the job 2 days before the completion of the work and B left the job one day after the C leaves the job. In what time will the whole work be finished?

Sol:

$$\begin{array}{r} A - 8 \quad 6 \\ \diagdown \quad \diagup \\ B - 16 \quad 2 \\ \diagup \quad \diagdown \\ C - 24 \end{array}$$

$$\begin{array}{r} 48 \\ + 04 = 2 \times 2 \\ + 03 = 3 \times 1 \\ \hline 55 \\ 6+3+2 = \frac{55}{11} = 5 \text{ days.} \end{array}$$

Q. 16 A do a job in 10 days, B do it in 15 days, they start the work together then after how many days B left the job if the complete job is finished in 8 days?

Sol: 3 DAYS

Q. 17 X can do a work in 30 days, Y can do the same work in 40 days, Z can do the same 20 days. If X left the work after 4 days of starting, Z left the work 1 day before the end of work. So in how many days will the work be finished?

Sol:  $12 \frac{2}{9}$  DAYS

**RATIO BASED QUESTION:**

Q. 18 Ratio of efficiency of A and B is 5 : 7. If A can do a work in 21 days then in how many days will B finish the work alone?

sol: Basic:

$$A : B$$

$$5 : 7$$

$$\text{so, efficiency of } A = 5x$$

$$\text{efficiency of } B = 7x$$

$$\text{Total work} = 5x \times 21 = 105x$$

$$B's \text{ time} = \frac{\text{Total work}}{\text{efficiency}} = \frac{105x}{7x} = 15 \text{ days}$$

Q. 19 The working capacity of A is 50% more than B. If A can complete a work in 12 days then in how many days can B complete this work alone?

sol:

$$A : B$$

$$150 : 100$$

$$3 : 2 - \text{efficiency}$$

$$2 : 3 - \text{time}$$

$$\begin{matrix} \times 6 \\ \downarrow \\ 12 \end{matrix} \qquad \begin{matrix} \times 6 \\ \downarrow \\ 18 \text{ days} \end{matrix}$$

Q. 20 The working efficiency of X is 60% more than Y. If they work together can complete it in 7 days then in how many days will Y finish it?

sol:  $18\frac{1}{5}$  DAYS

Q. 21 The ratio of efficiency of A and B is 3 : 4. Time taken by B is 9 days then in how much time will A complete the total work?

sol: 12 DAYS

#TRICK

$$A : B$$

$$\text{efficiency } 5 : 7$$

$$\text{time } 7 : 5$$

$$\left. \begin{array}{l} \downarrow \\ x3 \end{array} \right| \left. \begin{array}{l} \downarrow \\ x3 \end{array} \right|$$

$$21 \quad 15 \text{ days}$$

When total work is same, then efficiency  $\times \frac{1}{\text{time}}$

**MDH BASED QUESTIONS:**

Q. 22 In these type of questions, we compare things with other, one point is totally given examiner and in another point, something is missing and we have to find that.

Sol: Formula:

$$\frac{M_1 D_1 H_1 \times \text{Other}}{W_1} = \frac{M_2 D_2 H_2 \times \text{Other}}{W_2}$$

M - Man/Woman/child/person.

D - Days

H - Hours

W - Work

Q. 23 16 persons can complete a work in 10 days then how many persons are required to complete this work in 40 days?

Sol:

$$\frac{M_1 D_1 H_1}{W_1} = \frac{M_2 D_2 H_2}{W_2}$$

$$\frac{16 \times 10}{1} = \frac{x \times 40}{1}$$

$$x = 4 \text{ Days.}$$

Q. 24 20 men do  $\frac{3}{5}$  of the work in 450 days then how many persons are required to complete the remaining work in 75 days?

Sol:

$$\frac{20 \times 450}{\frac{3}{5}} = \frac{x \times 75}{(1 - \frac{3}{5})}$$

$$\frac{20 \times 450 \times 5}{3} = \frac{x \times 75 \times 5}{2}$$

$$80 \text{ men} = x$$

$\therefore \left. \begin{array}{l} \text{Total quantity of any} \\ \text{work is 1 in itself.} \end{array} \right\}$

Q. 25 280 women can complete  $\frac{3}{2}$  work in 80 days then how many women are required to complete  $\frac{7}{2}$  work in 40 days?

Sol: 240 WOMEN

Q. 26 20 children can complete 2 works in 40 days, working 8 hours per day. So 40 children can do 1 work in how many days, if they work 4 hours per day?

Sol: 20 DAYS

**OR - AND TYPE QUESTIONS:**

Q. 28 If 4 men or 5 women can complete a work in 43 days then in how many days 3 men and 7 women can complete it?

Sol: Basic - 1

$$\text{If 4 men work then work} = 4m \times 43 \quad (1)$$

$$\text{If 5 women work then work} = 5w \times 43 \quad (2)$$

$$\text{eqn } (1) = \text{eqn } (2)$$

$$4m \times 43 = 500 \times 43$$

$$\frac{M}{W} = \frac{5}{4} \quad \text{or. } 4m = 500$$

$$1m = \frac{5}{4} w, 1w = \frac{4}{5} m$$

Let's consider eqn (1) total work then :

Time taken by 3 men and 7 women.

$$= \frac{4m \times 43}{3m + 7w} = \frac{4m \times 43}{3m + 7 \times \frac{4}{5} m} \quad \left\{ 1w = \frac{4}{5} m \right.$$

$$\therefore \frac{4m \times 43}{15m + 28m} = \frac{4m \times 43 \times 5}{43m} \\ \frac{5}{5} = 20 \text{ days.}$$

Basic - 2

$$4m = 500 \quad (\text{It is found in Basic-1})$$

$$1m = \frac{500}{4}$$

Let's consider total work eqn (2) from Basic - 1 then,

# TRICK / BEST METHOD

$$4m = 500$$

$$m : w$$

$$5 : 4$$

Apply M.D.H formula.

$$4m \times 43 = (3m + 7w) \times x$$

$$4 \times 5 \times 43 = (3 \times 5 + 7 \times 4) \times x$$

$$x = 20 \text{ Days.}$$

Or.  $\therefore$  Choose one from all  
 { "OR" related data }

$$5w \times 43 = (3m + 7w) \times x.$$

$$5 \times 4 \times 43 = (3 \times 5 + 7 \times 4) \times x$$

$$x = 20 \text{ days.}$$

$$\begin{aligned}
 \text{Time taken by 3 men and 7 women} &= \frac{500 \times 43}{3M + 7W} \\
 &= \frac{500 \times 43}{3 \times \frac{5}{4} W + 7W} \\
 &= \frac{500 \times 43}{4300/4} = 20 \text{ days.}
 \end{aligned}$$

Formula method:

$$\begin{array}{ccc}
 \cancel{4m} = 500 & & 43 \text{ days} - (1) \\
 \cancel{3m + 7W} & & x \text{ days} - (2)
 \end{array}$$

Let's multiply eq<sup>n</sup> (1) with data and divide by sum of cross multipliers of number.

$$= \frac{4 \times 5 \times 43}{28 + 15} = \frac{4 \times 5 \times 43}{43} = 20 \text{ days}$$

Q. 29 If 4 men or 6 women or 8 children can do a job in 39 days then in how many days can 1 man and 1 woman and 1 child complete it?

Sol:  $4m = 6W = 8C$

$$m : w : c$$

$$6 \times 8 : 4 \times 8 : 4 \times 6$$

$$6 : 4 : 3 \quad 4m \times 39 : (1m + 1w + 1c) \times x$$

$$4 \times 6 \times 39 : (6 + 4 + 3) \times x$$

$$24 \times 39 = 13 \times x = 72 \text{ days} = x$$

Q. 30 3 men or 5 women can complete  $\frac{3}{4}$  part of the job in 40 days then in how many days 5 men and 7 women can complete the whole work?

Sol:  $17\frac{9}{13}$  DAYS

Q. 31 3 men or 6 women or 12 children can complete  $\frac{4}{7}$ th part of the job working 4 hours a day in 30 days. Then in how many days can 2 men and 5 women and 2 children complete  $\frac{2}{7}$ th part of the job working 3 hours a day?

Sol: 12 DAYS

#### MORE TIME TAKEN TYPE QUESTIONS:

Q. 32 Salman alone takes 4 more days than taken by Salman and Rushid together while doing a work, Rushid alone takes 9 more days than taken by Salman and Rushid together. What is the time taken by Salman and Rushid while working together?

Sol:

#### Basic:

Let's consider time taken by Salman and Rushid is  $x$

so:

$$\text{Salman} - x+4 \quad (x+9)$$

$$\text{Rushid} - x+9 \quad (x+4)$$

$$(x+9)(x+4) - \text{Total work}$$

Time taken by Salman and Rushid

$$\therefore \frac{(x+9)(x+4)}{x+9+x+4} = x$$

$$\frac{x^2 + 9x + 4x + 36}{2x + 13} = x$$

$$x^2 + 13x + 36 = 2x^2 + 13x$$

$$2x^2 - x^2 = 36$$

$$x^2 = 36$$

$$x = 6 \text{ days.}$$

#### #TRICK-

Multiply the more no. of days of both people and underroot that, we will get the time taken by both.

$$\Rightarrow \sqrt{4 \times 9} = 6 \text{ days.}$$

Q. 33 A takes 36 more days than taken by A and B together, B takes 64 more days than taken by A and B together, what is the time taken by A alone in doing the complete work?

sol: 84 DAYS

Q. 34 X takes 16 more days than taken by X and Y together, Y takes 25 more days than taken by X and Y together. what is the time taken by Y alone in doing the complete work?

sol: 45 DAYS

## TIME & DISTANCE

---

Distance :- Distance is a numerical measurement of how far objects or points are.

Time :- Time taken to cover a particular distance considered time over here.

Speed :- The rate at which someone or something moves.

$$\Rightarrow \text{Total distance} = \text{Speed} \times \text{Time}$$

$$\text{Speed} = \frac{\text{distance}}{\text{Time}}$$

$$\text{Time} = \frac{\text{distance}}{\text{Speed}}$$

$\Rightarrow$  conversion of distance:-

$$1 \text{ Km} = 10 \text{ Hectometer}$$

$$1 \text{ Hectometer} = 10 \text{ Decameter}$$

$$1 \text{ Decameter} = 10 \text{ meter}$$

$$1 \text{ Meter} = 10 \text{ decimeter}$$

$$1 \text{ decimeter} = 10 \text{ Centimeter}$$

$$1 \text{ Centimeter} = 10 \text{ milimeter}$$

→ During Solving Question, we need to change unit.

$$1 \text{ km/hr} = 5/18 \text{ m/sec.}$$

$$1 \text{ m/sec} = 18/5 \text{ km/hr}$$

$$1 \text{ km/min} = 50/3 \text{ m/sec.}$$

$$1 \text{ m/sec} = 3/50 \text{ km/min}$$

→ Average Speed =  $\frac{\text{Total distance}}{\text{Total time}}$

When, Speeds are  $x \text{ km/h}$ ,  $y \text{ km/h}$

$$\text{then Average Speed} = \frac{2xy}{x+y}$$

when speeds are  $x \text{ km/h}$ ,  $y \text{ km/h}$ ,  $z \text{ km/h}$

then

$$\text{Average Speed} = \frac{3xyz}{xy+yz+zx}$$

when speeds are  $x \text{ km/h}$ ,  $y \text{ km/h}$ ,  $z \text{ km/h}$ ,  $w \text{ km/h}$

then

$$\text{Average Speed} = \frac{4ABCD}{ABC + ABD + BCD + ACD}$$

→ when distance is constant

then, Speed  $\propto 1/\text{Time}$
